

## **popHealth Open Source Clinical Quality Measure Reporting Tool**

### **Office of the National Coordinator for Health IT**

This demonstration will provide an overview of popHealth, an ONC-sponsored reference implementation for Meaningful Use clinical quality measure reporting. popHealth integrates with data from a provider's EHR (using established HITSP C32 or CCR data standards) to produce clinical quality measure reports for the 44 core and non-core Stage 1 measures. popHealth provides physicians with a better understanding of the overall health of their patient population and streamlines the submission of quality measures to federal agencies as part of the EHR incentive program. popHealth is easy to use, and available as open-source software.
